Dear Sir or Madam,

Throughout the years of my professional work, I've gained a lot of expertise in web development. I'm especially proud of becoming a Technical lead and manager **from the ground up**. Which was a challenge, but also part of my motivation to participate in a better world (being empathic) and strive for excellence in solutions.

Presently, I'm **refocusing** my career aiming to get into the **field of artificial intelligence** and neural networks, which is the key reasons I'm applying. I have participated in building neural networks, and I'm also **building one of my own** already (which you can check on my github and pypi).

I believe my experience as a (web) software engineer and leadership skills can add up to my lack of experience in the field. Furthermore, I can **provide a holistic solution** to your product or client's with ad-hoc technologies and frameworks, which can be mighty to have in a team.

I know from your post that you're seeking a senior A.I. engineer skilled in python and pytorch. And I think these accomplishments will put me in the picture:

- AlicIA. **My neural networks' evaluator** for image classification. Compares several different neural network models (homemade, and pretrained), with torch vision data to measure time performance and accuracy. You can also use this tool to test, train and predict images classification.
- At Bonial. I worked implementing web solutions to generate the human **interfaces to input of correction of the labels** vectors.
- Lead and **manage multidisciplinary** teams since 2018.

I'd love to speak with you soon about how my full-stack solutions and sprint plannings can help in the goals and challenges you're facing.

Kind and best regards,
